

TEST - 2

1. CSS and uses:

- CSS stands for Cascading style sheet.
- CSS is used to style and design HTML webpages.
- It controls colors, layouts, fonts, animations and responsiveness.
- CSS helps webpages to make attractive and userfriendly by adding designs and layouts.

- 2.
- Inline CSS
 - Internal CSS
 - External CSS.

3.

Type	Description	Structure
Inline CSS	CSS directly written inside an HTML Element using style attribute specifically chooses the Element.	<code><h1 style="property: value"></code>
Internal CSS	CSS written inside <code><style></code> tag within the same HTML file	<code><style></code> property: value; <code></style></code>
External CSS	CSS written in a separate CSS file with the Extension of .css and linked to HTML.	style.css

4. • Inline css has the highest priority.

• priority order :

1. Inline

2. Id

3. class

4. Element

5. External.

5. • External css is the mostly used in real-time projects.

• It keeps code clean

• Reusable across multiple pages

• Better organization

• Faster development in large projects.

6. COMMON SELECTORS :

• Element selector

• class selector

• ID selector

• universal selector

• Group selector

OTHERS :

• Child selector

• Descendant selector

• Attribute selectors.

class	ID
• uses . symbol to select • can be used for multiple Elements • Reusable • lower specificity	• uses # symbol to select • used for only one unique element • unique • higher specificity

8. Universal selector:

- universal selector represented as *
- It selects all HTML elements on the webpage.

purpose:

- Removes default browser spacing.
- Applies common styles from globally.
- Creates consistent layout behaviour.

9. Cascading in CSS:

- cascading refers to the process of deciding which style should be applied when multiple styles target the same element.
- CSS follows, priority, specificity and order of declaration.

10. Specificity in CSS:

- specificity determines which CSS rule has higher importance when multiple selectors target the same element.

specificity order:

Inline > ID > class > element.

11. BLOCK LEVEL	INLINE
• Always starts on a new line • It took full width of the screen. • Can set width and height • block level inside block level is not allowed. inline inside block level is allowed.	• stay in the same line. • It only take the required width on the screen. • width and height usually don't work properly. • block level inside Inline is not allowed. • same as block level

12. Flexbox:

- flexbox is a CSS layout model used to align and distribute elements efficiently inside a container.
- used to create responsive layout.
- align items horizontally and vertically.
- controls spacing between elements.

13.

Justify - Content	align - items
• centre items horizontally • works on main axis • used for spacing b/w items ex: center, space-around, space-evenly.	• align the items vertically • works on cross axis • used for positioning items vertically. ex: center, flex-start, flex-end

14. CSS units are used to define the size of elements, text, spacing and layout.

- The units px, em, rem and percentage differ in how their values are calculated.

px	- fixed pixel values	- Exact screen pixels
em	- Relative unit	- parent element font size
rem	- Relative unit	- Root element font size
%	- percentage unit	- parent container width/height

↳ Creates flexible & responsive layouts

15. RGB, RGBA and HEX :

RGB - defines colours using Red, Green and blue values. Ex: `color: rgb(255, 0, 0)`

RGBA - RGB with an additional Alpha, values for transparency. Ex: `color: rgba(255, 0, 0, 0.5)`

HEX - defines colors using hexadecimal codes.
Ex: `color: #ff0000;`
